bokeh.sampledata ¶

The `sampledata` module can be used to download data sets used in Bokeh examples.

The simplest way to download the data is to use the execute the command line program:

```
bokeh sampledata
```

Alternatively, the `download` function described below may be called programmatically.

```
>>> import bokeh.sampledata
>>> bokeh.sampledata.download()
```

By default, data is downloaded and stored to a directory `$HOME/.bokeh/data`. (The directory is created if it does not already exist.) Bokeh looks for a YAML configuration file at `$HOME/.bokeh/config`. The YAML key `sampledata_dir` can be set to the absolute path of a directory where the data should be stored. For instance adding the following line to the config file:

```
sampledata_dir: /tmp/bokeh_data
```

will cause the sample data to be stored in `/tmp/bokeh_data`.

download(*progress*: *bool* = *True*) → *None* [source]

Download larger data sets for various Bokeh examples.
